

What PixieDuster does

Give an AI a real identity to be - a character you invent, or your own voice.

1. Tell it who to be. Three ways.

Any identity you need to be true to. Mix them if you like.

Invent a character

```
--describe "a friendly desktop  
robot with great humor"
```

From writing samples

```
--from ./essays  
(text, PDFs, screenshots)
```

From a git repo

```
--repo .  
(clone your own voice)
```

2. It asks you three quick questions

Things your writing cannot reveal on its own. You answer with the arrow keys, and set how funny it should be with a slider.

3. It writes one file

persona.md - a full specification of that identity's voice: how it talks, what it finds funny, words it would never use. For a repo it writes AGENTS.md instead.

4. Any AI reads that file and becomes it

Paste it into a chatbot, a robot's voice, a game character. Claude Code and Cursor pick up AGENTS.md on their own.

The difference it makes

GENERIC AI

"Let's delve into this crucial tapestry of features that serve as a testament to..."

A REAL IDENTITY

"Well, that's officially on fire. Fun! Give me a second, partner." - Bolt, a desktop robot, humour set to 8.

One command does all of it:
pixieduster clone
